

Executive Incident Investigation Report

Case: Analysis of Harassment Traffic via Wireshark / TShark | Ref: SBT-DF203

1. Case Overview

This digital forensics investigation analyzes network packet captures (**nitroba.pcap**) concerning harassing electronic communications directed at faculty members within the Nitroba University environment. Utilizing TShark analytical tooling, the investigation successfully isolated network endpoints, extracted plaintext payloads, identified hardware MAC addresses, and correlated client session identifiers.

2. Forensic Artifact Summary

Artifact Category	Identified Value / Indicator
Suspect Local IP	192.168.15.4
Target Web Server IP	69.25.94.22 (www.willselfdestruct.com)
Target Recipient	lilytuckrige@yahoo.com (Faculty Target)
Harassment Payload	"you can't find us, and you can't hide from us. Stop teaching. Start running."
Hardware MAC Address	00:17:f2:e2:c0:ce (Apple NIC)
OS & Browser Footprint	Mac OS X 10.5.4 / Safari 3.1.2

3. Technical Methodology & Evidence Path

The investigation followed rigorous chain-of-custody and analytical standards across structured phases:

- **Phase I (Network Identification):** Filtered HTTP traffic to isolate communication between internal subnet IP 192.168.15.4 and external destinations.
- **Phase II (Payload Verification):** Parsed URL-encoded form parameters within packet frame 83601 to confirm exact harassment text.
- **Phase III (Hardware Attribution):** Extracted Layer 2 Ethernet headers to identify physical manufacturer characteristics.
- **Phase IV & V (Session & Client Profiling):** Extracted HTTP cookies and User-Agent strings confirming client software footprint.

4. Conclusion & Recommendations

Corroboration between Layer 2 hardware identifiers (Apple network interface) and Layer 7 client signatures (Mac OS X Safari User-Agent) confirms the suspect device fingerprint. It is recommended to cross-reference physical access logs with the isolated MAC address 00:17:f2:e2:c0:ce during the time window of frame 83601.
